5 Tips for Cybersecurity

A guide to protecting your business

71% of data breaches happen to businesses with less than 100 employees

"Data breaches don't just happen to large companies like the NHS and Talk Talk, they are happening to businesses of all sizes."

Smaller businesses are easy targets

Small and midsize businesses (SMBs) spend less on cybersecurity than larger organisations. Cybercriminals often target SMBs because they have a lot of personally identifiable information that can be used for identity theft, tax fraud and other financial crimes.

SMBs collect customer, employee and vendor names, addresses, dates of birth, driver's licenses and insurance information. This information is everything a criminal needs to commit identity theft and other cybercrimes.

# 60% of small businesses go out of business after a data breach

Data breaches are expensive and can damage a company's reputation.

Legal, IT, breach notification and identity monitoring expenses can add up quickly.

After a data breach, customers often leave a business due to lack of trust, and negative publicity keeps newer customers from utilising the services of the business.

Data breaches cause owners and employees emotional stress and anxiety.

Ransomware is a real threat to all businesses

Ransomware is a method of holding data hostage until a ransom or payment has been made to release the data. Ransomware is usually associated with fake emails called phishing emails that contain malicious attachments such as Microsoft Word documents or PDF files. Once these attachments are opened, a program locks or encrypts all the data on the workstation. Ransomware can spread to other workstations and servers on the network.

Criminals are targeting healthcare organisations, law firms, financial service organisations and all businesses that have valuable data that they can't afford to lose. These criminals realize that it is easier to hold a company's data hostage than it is to steal the data and use it. The risk of being caught spreading ransomware is much lower than traditional hacking or cybercrime.

Hospitals, law firms and many other organisations have been shut down for weeks as a result of successful ransomware attacks that have encrypted the entire network and made access to company data and systems impossible.

"It only takes one employee to fall for a phishing scam"

Employees are your weakest security link

An IBM study found that 95% of data breaches are caused by employee mistakes. These mistakes include falling victim to a phishing or ransomware attack, losing a laptop or smartphone, or sending sensitive information to the wrong recipient.

Employees need security awareness training to help prevent mistakes that can lead to data breaches.

Best Practices

Although criminals are targeting SMBs, employing best practices can help protect your company against cyberattacks and data breaches.

The following are best practices that you can take to minimise the chance of data breaches.

Computer
RESCUE IT

Secure passwords

Passwords are the key to networks, customer information, online banking and social media.

Password best practices include:

➢ Use strong passwords.
  ✓ **Make the password at least 8 characters long.** The longer the better. Longer passwords are harder for thieves to crack.
  ✓ **Consider using passphrases**. When possible, use a phrase such as "I went to St Johns High School in 2004" and use the initial of each word like this: "Iw2LMSi#2004".
  ✓ **Include numbers, capital letters and symbols.**
  ✓ **Don't use dictionary words.** If it's in the dictionary, there is a chance someone will guess it. There's even software that criminals use that can guess words used in dictionaries.

➢ **Change passwords.** Passwords should be changed every 60 to 90 days.

➢ **Don't post it in plain sight.** This might seem obvious, but studies have found that a lot of people post their password on their monitor with a post-it note!

➢ **Consider using a password manager.** Programs or Web services let you create a different very strong password for each of your accounts, but you only have to remember the one password to access the program or secure site that stores your passwords for you.

➢ **Consider using multi-factor authentication.** Set up multi-factor authentication that requires a code that is displayed on your phone. This way hackers cannot access an account without having physical access to your phone.

Computer

Encrypt data

Lost laptops, smartphones and USB drives continue to cause data breaches.

Many businesses don't realise how much sensitive information is on mobile devices. Sensitive information could be in emails, spreadsheets, documents, PDF files and scanned images.

The best way to protect sensitive information is to use encryption.

Types of encryption

➢ **Mobile device encryption.** Laptops, smartphones and USB drives can all be encrypted. This will protect any data that is on these devices.

➢ **Email encryption.** Emails could contain sensitive information and should be encrypted. Secure email will protect the data that is sent.

➢ **Workstation encryption.** Like laptop encryption, desktops and workstations can be encrypted to protect any data stored on them. Workstation encryption is very important in the event of a break-in and theft of workstations. Without encryption, a stolen workstation may result in a data breach.

Employee Security Training

95% of data breaches are caused by employee mistakes. It is critical to ensure that employees understand the risks to sensitive information and the threat of data breaches.

Phishing and ransomware are leading methods of attacks. Employees need to know how to spot phishing emails, phishing websites and the dangers of email attachments.

Training needs to take into account the dangers of hacking, stolen mobile devices, posting sensitive information on social media and other causes of data breaches.

A good training program will continually remind employees about the dangers of data breaches and how to avoid becoming a victim. Cybercriminals are developing new scams and attacks everyday and employees should be made aware of these scams.

Data backup and disaster recovery

Backing up data will protect your business from data loss due to damaged servers or malicious code such as ransomware.

A fire, flood, explosion, human error or natural disaster can destroy systems that contain valuable information. Having up-to-date data backups and a disaster recovery plan will help recover and restore valuable information.

Many company's go out of business after a data breach because they can't continue to operate without having access to customer information, business process documents, financials and other necessary information. Data backups ensure that data is recoverable.

It is recommended that automated backups occur that securely copy data offsite.

Data backups should be periodically tested to ensure the data is able to be recovered.

"Only 6% of companies survive longer than 2 years after a significant data loss"

Perform a security risk assessment

A security risk assessment (SRA) is a critical step to understanding the risk to your business and sensitive information.

An SRA will inventory customer, employee, vendor and sensitive data, identify how you are currently protecting the data and make recommendations on how to lower the risk to the data.

An SRA will help you to understand your risk of phishing scams and ransomware, the dangers of lost mobile devices, the risk of insider threats and how prepared you are in the event of a disaster.

Without a thorough understanding of risk, it is difficult to implement the safeguards needed to protect your business. Cybersecurity is a business risk and needs to be evaluated and mitigated just like other business risks.

"Many SMBs don't know where their critical data is, how it is being protected or what the risks are to the data. Cybersecurity is a business blind spot."

Free Network & Cyber Security Assessment for your Company

Claim your free assessment today. It comes complete with a FREE client risk report.

6-8 pages that provides an overview of the devices on your network along with a network risk score and analysis of each potential issue that we uncover.

Dark Web Scan. Free scan of the dark web to find out if your domain, emails address and passwords have been exposed on the dark web.

Free Online Cyber Security Awareness Training for you and your staff. Focuses on what to look out for with phishing scams and ransomware.

Contact us now to arrange your Free Network & Cyber Security Assessment:
